

A general guide to ironers and problems associated with ironing.

Introduction.

The quality, drying efficiency, production and overall performance of an ironer is essential in the majority of laundry's.

Where the criteria for good ironing is not achieved, other areas besides the ironer may also need investigation.

This guide is intended to give a brief insight into each area and show how any one malfunction or neglects to follow certain procedures prior to the ironing process will have an almost certain adverse effect on the end result.

Good housekeeping, training and planned preventative maintenance is the key to success.

Acknowledgements

The authors Ian Hargreaves, Technical consultant for Laundry Solutions and Gary White, Sales Director for Severnside fabrics Ltd., would like to acknowledge the help and advice they have received from manufacturers, customers and all those associated with the laundry industry
